The roundabout Plymouth City

Northern Cross is the belt of the city center, connected to a variety of pedestrian and vehicular circulation routes. Its design is based on the idea of a continuous movement path through underground passages. Although the alternative route to the train station is informal and indirect, thanks to the over a sense of visual clarity. This is a direct contrast to the rigidity and linearity of the northern axis of intermediate

New Station Military School

Art Museum of São Paulo - MASP

The Museum MASP is one of the most famous museums of São Paulo. Projected by the Italo-Brazilian architect Joaquim Vilanova Artigas in the 1950s, it rapidly became known during the weekends a fair of antiques and various artistic, cultural, political or even student demonstrations.

Located on the most famous avenue of the city, Avenida Paulista, the geographic center of the financial district, the MASP is a cantilevered concrete box, which rests on two concrete pillars. The distance between the pillars is one of the central features of the great box, which carries the name name of the museum, demonstrating its value as a building frame.

GUIDING QUESTIONS

1 – How can the independent unit of Zanjón be transformed into an urban piece, incorporating the damaged or unused infrastructure to produce urban value?

R- The independent unit of Zanjón has numerous possibilities and potentialities, being these characteristics faced by the group from the point of view of a connector of equipment and a driver of economic flows and people. Instead of a geographical and urban boundary, the Zanjón can become an integrator of various districts of the city and the pre-existing degraded structures, giving them a new intensity and activity, leading the population by diverse axes such as leisure, the presence infrastructure and equipment, as well as transport and economic axis.

2 – How to recognize the territorial unit Zanjón de la Aguada , consolidating an integrator axis that leverages local development , incorporating the existing urban infrastructure ?

R - The territorial unit of Zanjón can be recognized from its geographical and urban character as an axis of high quality , but still latent , and partly still in its development. The main intention is to bring back Zanjón the urban landscape using it as a catalyst for the development of the area in aspects of the everyday life of the population , which does not only mean to bring back the natural landscape but also to create a new urban landscape that is more attractive to the river border . Taking advantage of the empty spaces and the few fragmented green areas and the vehicular axis, the strategy is to make Zanjón de la Aguada an integrator axis making use of the rides through green boulevards, that would be paths that mix vegetation with many other axes as well, connecting to the parks in the new contours of the river and to the areas of trade and equipment, both existing and proposed.

MAP OF STRATEGIES

From the chosen strategies , and the connections made between them in the area , the intentions of the project are the following:

1) Create a new road that connects the north to the south, in a more complex and comprehensive manner, that is to undergo the physical changes in your road structure, necessary for the road network to create a context that makes them possible , and it can only happen with changes in the existing alley at the radius of the river.

2) Bury the road that is the most responsible for the fragmentation of spaces in the area and for the creation of several unconnected islands , so that can be a corridor between islands and create a larger multipurpose, connector green space for it , which will be described below.

3) Keep the two great centers of trade (the Leader supermarket and the Jumbo) that characterize the area and generate an economic flow that already exists and empower them

4) This potentiation would occur from the union of islands already mentioned, which were created by the huge route of the road (Avenue Vespucio Norte Express, Matta and Ossa Centrals) and the creation of a new green space, the so-called Green Boulevards, linked to the park that will develop itself in the banks of Zanjón de la Aguada, whose main element is its own water.

4.1 3) Throughout this new public green space where the water of Zanjón will again be the protagonist of the landscape , the idea is to create unusual equipment of leisure , entertainment and trade, mixed in search , a hybrid of diverse uses to intensify the activities of the institutions already existing in the area.
